AMENDMENTS TO THE CLAIMS

1. (Previously presented) A method of processing data packets, comprising: receiving a plurality of the data packets at a selected node;

extracting only pertinent information from the data packets while ignoring nonpertinent information from the data packets, the pertinent information being pertinent to said selected node; and

generating a plurality of response data packets based on the pertinent information, wherein said extracting and generating steps are performed without use of a microprocessor.

- 2. (Original) The method of claim 1, wherein said extracting and generating steps are performed without use of a storage memory.
- 3. (Original) The method of claim 1, wherein said selected node includes a peripheral device, the pertinent information being pertinent to said peripheral device.
- 4. (Original) The method of claim 1, comprising the further step of transmitting a signal indicating that the response data packets should be sent.
- 5. (Original) The method of claim 1, comprising the further step of transmitting the response data packets to a packetized data network.
- 6. (Original) The method of claim 1, wherein said receiving step includes receiving the data packets from a packetized data network.

5

- 7. (Original) The method of claim 1, wherein said pertinent information includes a packet payload.
- 8. (Original) The method of claim 7, comprising the further step of passing the packet payload to a peripheral device.
- 9. (Original) The method of claim 1, wherein said extracting step includes extracting header information.
- 10. (Original) The method of claim 9, wherein said response data packets include the header information.
 - 11. (Previously presented) A data packet communication system, comprising: a peripheral device; and
- a filter device connected to said peripheral device, said filter device being configured to receive a plurality of data packets and identify only pertinent information in said data packets while ignoring non-pertinent information from said data packets, said pertinent information being pertinent to said peripheral device.
- 12. (Original) The system of claim 11, wherein said filter device is microprocessorless.

5

13. (Original) The system of claim 12, wherein said filter device is memoryless. 2001-0134.02/L110337.US

- 14. (Original) The system of claim 11, further comprising a packet generator connected to said peripheral device and said filter device, said packet generator being configured to generate a plurality of response data packets based on said pertinent information.
- 15. (Original) The system of claim 14, wherein said packet generator is configured to transmit said response data packets.
- 16. (Original) The system of claim 15, wherein said filter device is configured to transmit a signal indicating that said response data packets should be generated.
- 17. (Original) The system of claim 16, wherein said packet generator is configured to transmit said response data packets to a packetized data network.
- 18. (Original) The system of claim 17, further comprising a protocol state machine configured for receiving the signal from said filter device and issuing a request to said packet generator to transmit said response data packets.
- 19. (Original) The system of claim 11, wherein said filter device is configured to receive the data packets from a packetized data network.
- 20. (Previously presented) The system of claim 11, further comprising an interface interconnecting said peripheral device and said filter device.

- 21. (Previously presented) A data packet communication device, comprising:
- a filter device configured to receive a plurality of data packets and identify only pertinent information in said data packets while ignoring non-pertinent information from said data packets; and
- a packet generator configured to generate a plurality of response data packets based on said pertinent information.
 - 22. (Previously presented) The device of claim 21, wherein each of said filter device and said packet generator is microprocessorless.
 - 23. (Previously presented) The device of claim 22, wherein each of said filter device and said packet generator is memoryless.
 - 24. (Previously presented) The device of claim 21, wherein said packet generator is configured to transmit said response data packets.
 - 25. (Previously presented) The device of claim 24, wherein said packet generator is configured to transmit said response data packets to a packetized data network.
 - 26. (Previously presented) The device of claim 21, wherein said filter device is configured to transmit a signal indicating that said response data packets should be generated.

- 27. (Previously presented) The device of claim 26, further comprising a protocol state machine configured for receiving the signal from said filter device and issuing a request to said packet generator to transmit said response data packets.
- 28. (Previously presented) The device of claim 21, wherein said filter device is configured to receive the data packets from a packetized data network.
- 29. (Previously presented) The device of claim 21, wherein said packet generator comprises an N to M decoder.
- 30. (Previously presented) The device of claim 21, wherein said pertinent information comprises selected bytes within said data packets.
